

PREDICT once per unique state

K Kernel

Jev returns a typed answer distribution for every unique persona $\times$ content $\times$ situation $\times$ condition

$P(\text{answer} \mid \text{state})$

\$0.02–0.03

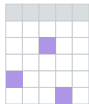

per 1,000 predictions

213 ms

median latency per call

State table

one row per unique state, queried once and reused by every agent

■ corrected cells

*tilts each cell to the
flagship's paired effect*

I Intervention anchors

a flagship LLM predicts sparse paired states under control and treatment

control

treatment

0.5–1.7% of the states

EXECUTE any number of agents

T Tabulated execution

event-keyed draws, with common random numbers across conditions

0.90 s

for 10^6 agents $\times$ 20 decisions

model effect x

E Error propagation

one shared draw per study and arm:

$$\theta = \beta x + b + u$$

93% / 96%

coverage of unseen human effects

Outcomes

intervention effects and decisions, each with two uncertainties

shared discrepancy

does not shrink with agents

Monte Carlo

shrinks as agents grow

–41%

effect error, Epstein

0.27 $\rightarrow$ 0.39

decision gain, SocSci210
